**Instructions for Generating Text Output**

The Enterprise Guide interface will generate output in several different formats.

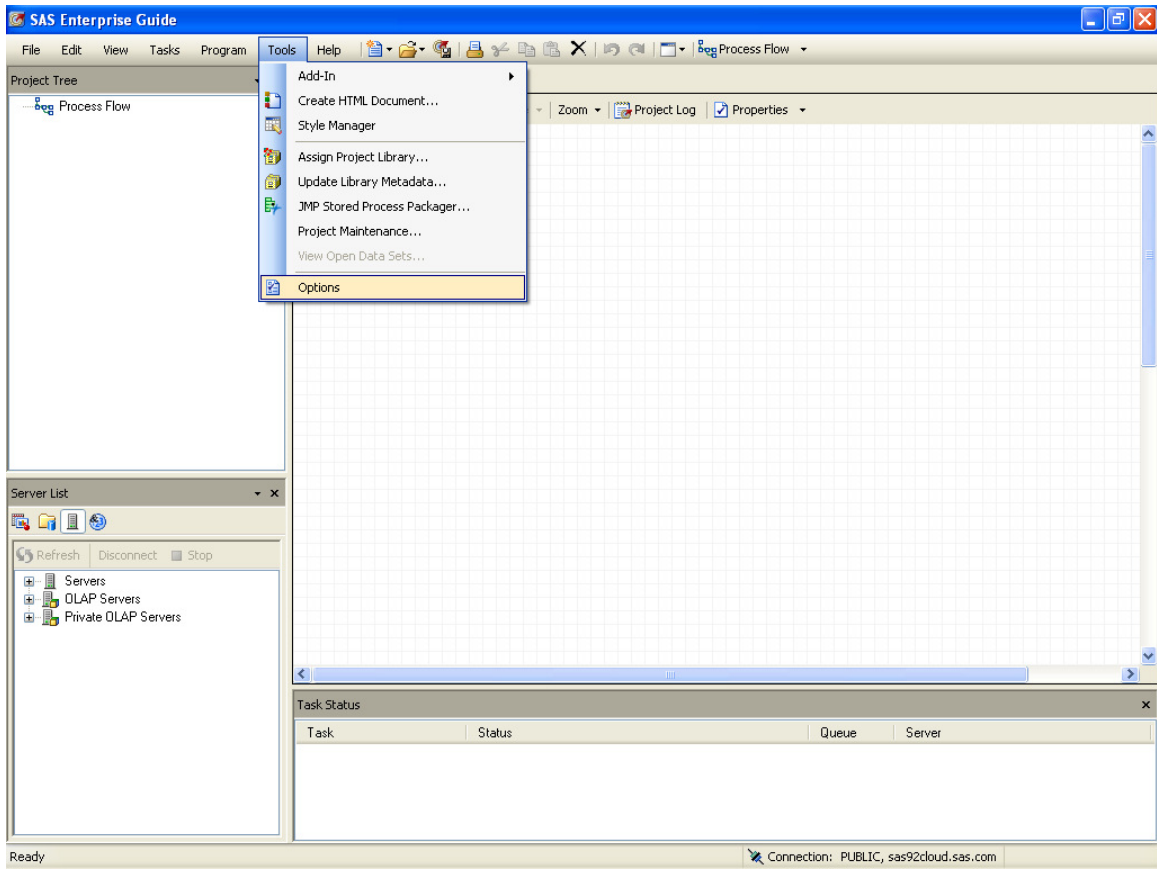

In some procedures that generate output (such as PROC PRINT and PROC REPORT) some programming statements and options used in the procedure are output specific. That means that certain statements or options can be used to change the display in one output type, but these same statements or options will have no impact on the display in another output type.

To maintain consistency with the programming statements and output shown in the book, I have covered the statements and options that can be used with Text/Listing Output format.

On the Programming Assignments, there are items which show a data display that was generated in the Text/Listing Output window and your task is to write the code to generate the same output.

To display the Text/Listing Output window in your Enterprise Guide session, do the following:

(1) On the Menu, select **Tools** and then **Options**

(2) When the **Options** box appears, select **Results** (or **Results General**). Then in the **Result Formats** Section at the top, select “**Text output**”. Also select “**Text output**” in the **Default** dropdown box. If you wish to also see the output displayed in the other formats, select any or all of the other output types. Each output type will be displayed in its own output window in your SAS Session. Click “**OK**” at the bottom of the window to save your changes.
